IceTheme is here to make your things as easy as possible providing you the tools that you need to make your website working as fast as a simple Joomla Installation. With the "Clone Installer" package you have the possibility to make your website exactly as you see on our demo page (http://demo.icetheme.com).

This feature will save you lot of time as you will have all the configuration and parameters setted by default, also you will have our sample images updated and every extensions enabled and working. So you have only to make changes and you are done.

Anyway be careful as this package will work only if you are starting your website from scratch. If you already have a working Joomla! website you should not make use of this feature as the database sql file may delete your current database. For more information on how-to set up our extensions on your current working website please refer to the paramters of each extensions on the main Extension page .

Clone Installer Video Tutorial

We have made a video to show you how to work with the Clone Installer package.
